

TaurusTech Power User Pack

Documentation v1.0

The TaurusTech Power User Pack is a streamlined Windows toolkit built for fast fixes, clean diagnostics, and proper maintenance. Nothing here is guesswork. Nothing is hidden. Every script is readable and intended to give you control over your system instead of leaving you fighting default Windows behavior.

FOLDER STRUCTURE

Root: TaurusTech.bat - Main launcher for the entire toolkit. Routes you to every module.

TaurusTech-Launcher.bat - Quick Scripts launcher. Runs cleanup, reset, and diagnostic scripts from a single menu.

01-Quick-Scripts: Rapid repair tools that fix common Windows problems like slow startup, broken networking, junk buildup, or stuck services.

02-Checklists: Human guided daily, monthly, and fresh install routines that keep systems healthy over time.

03-Config-Tweaks: Registry and script based tweaks that correct or improve Windows behavior, such as restoring classic context menus or enabling long file paths.

04-Workflow-Guides: Plain English guides for doing potentially risky tasks safely, such as driver updates or deep network resets.

05-Utilities: Diagnostic helpers such as GPU info, hashing, local port scanning, and basic RAM testing.

ROOT FILES

TaurusTech.bat: Serves as the main hub. When launched, it presents a menu that allows you to move into Quick Scripts, Checklists, Config Tweaks, Workflow Guides, or Utilities in a predictable way.

TaurusTech-Launcher.bat: Dedicated launcher for Quick Scripts. Lets you trigger cleanup, resets, service control, and system snapshots without digging through files manually.

QUICK SCRIPTS OVERVIEW

cleanup_startup.bat: Removes unnecessary startup entries to help reduce boot time and post login lag.

clean_temp.bat: Clears system and user temp directories to free disk space and remove leftover junk from installs and updates.

disable_bloat_services.bat: Disables low value Windows services that consume resources without providing meaningful benefit for a typical user.

kill_process.bat / kill_process.ps1: Terminates a specified process by name. The PowerShell version is more aggressive for stubborn tasks.

network_adapter_dump.ps1: Generates a detailed report of current network adapter configuration for reference and troubleshooting.

network_core_reset.ps1: Performs a deep network reset including core stack components such as Winsock and TCP settings.

network_reset.bat: Executes a lighter weight network repair that is safer to use as a first step before deeper resets.

system_info_snapshot.bat: Prints a full system snapshot including OS version, CPU, RAM, updates, and other core details.

TaurusTech_Service_Disabler.ps1: Targets and disables unnecessary background services using a curated list that avoids breaking normal day to day usage.

CHECKLISTS

Daily_Maintenance_Checklist.txt: Short routine that focuses on basic checks and quick health actions.

Monthly_Maintenance_Checklist.txt: Deeper actions such as cleanup, update review, and general performance checks.

Windows_FreshInstall_Checklist.txt: Step by step flow for configuring a fresh Windows installation like a power user rather than using only default settings.

CONFIG TWEAKS

ContextMenu_old.reg: Restores the classic full right click context menu in Windows 11 so options are not hidden behind extra clicks.

Disable_Bing_Search.reg: Removes Bing from the Windows Search experience to keep lookups local and reduce noise.

Enable_LongPaths.reg: Enables support for file paths longer than 260 characters to avoid path length errors in deep directory structures.

PowerTweaks.bat: Applies a group of quality of life tweaks to improve system usability and reduce annoyance in everyday workflows.

WORKFLOW GUIDES

How_to_Identify_Spyware_or_Bloat.txt: Shows how to evaluate installed software and services so you can separate necessary tools from junk and potential threats.

How_to_Reset_Network_Safely.txt: Explains the difference between shallow and deep resets and when to use each without wiping out important configuration unnecessarily.

Safe_Driver_Update_Guide.txt: Provides a safe process for updating drivers while reducing the risk of system instability or boot failures.

UTILITIES

get_gpu_info.cmd: Prints GPU model and driver information for quick hardware checks and troubleshooting.

TaurusTech-FileHash.ps1: Generates standard hashes such as MD5, SHA1, and SHA256 so files can be verified for integrity or tampering.

TaurusTech-PortScan.ps1: Scans local ports to show what is listening on the system, useful for security reviews and service debugging.

TaurusTech-RAMTest.bat: Runs a simple memory check that can help reveal early RAM problems before they turn into frequent crashes.

SUMMARY

The TaurusTech Power User Pack is built to be clean, modular, and understandable. Every file serves a clear purpose. Scripts are not black boxes; they are starting points you can inspect, modify, and extend. The goal is to make Windows troubleshooting and maintenance predictable, faster, and less frustrating.
